10. Quick reference

1. What does BrengMeTerug do?

BrengMeTerug remembers a place you want to return to, such as your parked car, hotel, bicycle or another location.

Save the position in the app and later open it in a navigation app. BrengMeTerug is not a standalone navigation service.

2. Before you start

Turn on Android Location and grant BrengMeTerug location permission when requested.

For better accuracy, wait outdoors until the position is reasonably precise. Buildings, tunnels and other obstacles can affect GPS.

3. Save a location

Stand at the place you want to remember. Open BrengMeTerug and tap “Save my current location” (the Dutch interface may say “Mijn huidige locatie opslaan”).

Choose a type: Car, Hotel, Bicycle or Other. Enter a recognizable label, such as “Car – parking garage”.

Check the displayed position and estimated accuracy, then confirm. The saved location appears in the list.

4. Type and label

The type categorizes a location. The label is the name shown in the saved-location list.

Select the type first, then enter a clear label. Use distinct names for different parking places.

5. Find a saved location

Open the saved-location list. Find the desired label and select it.

Check that you selected the correct location, especially if several entries have the same type.

6. Navigate back

For the saved location, choose “Take me to...” (Dutch: “Breng me naar...”) or the available navigation action. Android presents compatible apps.

Choose Google Maps, Waze or another available navigation app and follow its directions.

BrengMeTerug does not calculate the route itself. Route options and traffic information depend on the chosen app.

7. Walking and Waze

Waze is designed mainly for driving and does not provide full walking-route support.

For a walking route, choose an app that supports pedestrian navigation, such as Google Maps, and select walking mode.

8. Accuracy and safety

The app may display an estimated accuracy in metres. This does not guarantee that the saved point matches an entrance or parking bay exactly.

Check your surroundings and follow local traffic rules. Do not rely on this app as your sole safety tool in an emergency.

9. Troubleshooting

No position: check Android Location and BrengMeTerug permissions; retry where GPS reception is better.

No navigation app: install a suitable map app or review the choices Android offers.

Wrong destination: check the label and the original GPS reading; save the location again if needed.

10. Quick reference

Save: “Save my current location” → type → label → confirm.

Return: choose saved location → “Take me to...” → navigation app.

Walking: use a navigation app with pedestrian routing. Test the process somewhere familiar first.
